

# Team Chat

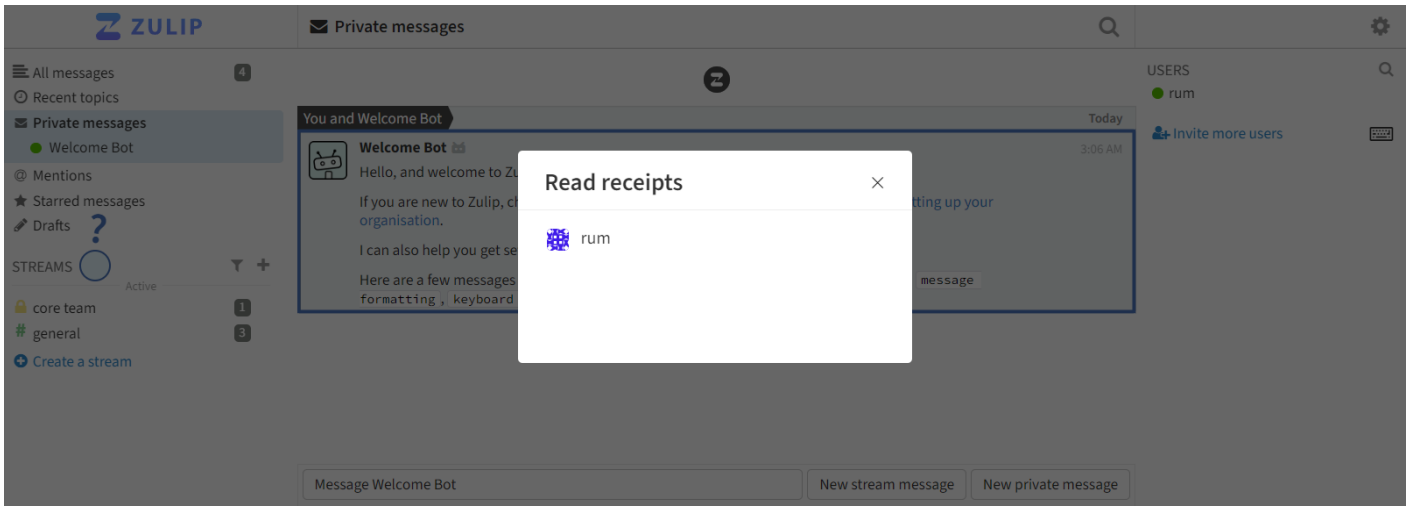

The RackCorp UMS provides very powerful chat features, allowing organisations to have logically segmented chat sessions, while also providing user-to-user chat capabilities.

Chats are segmented into "streams". Another representation of a 'channel'. Users can enjoy full rich chat functionality within the team chat for these streams across multiple platforms and devices.. They may subscribe to ones interesting to them and configure notifications to their liking to these streams.

All chat content is saved on the server side. Users do not need to worry about device synchronisation, disappearing messages or limited chat history. In addition users may check the status of their discussions via the read receipts function
